How does the Wolverine Mini Film Scanner work?

The scanner kit comes with adapters for film negatives, slides, 8mm and Super 8 film reels, 110 film negatives, and 110 slides.

Once the chosen format is placed in its corresponding adapter, the adapter slides through the device from right to left. The film scanner captures the image as it goes through the device, where it is then saved as a digital file to the inserted SD card.

Once the image is digitized, you can upload it to your computer using the included USB cable.

Watch the tutorial below to see the Wolverine Mini Film Scanner in action!
